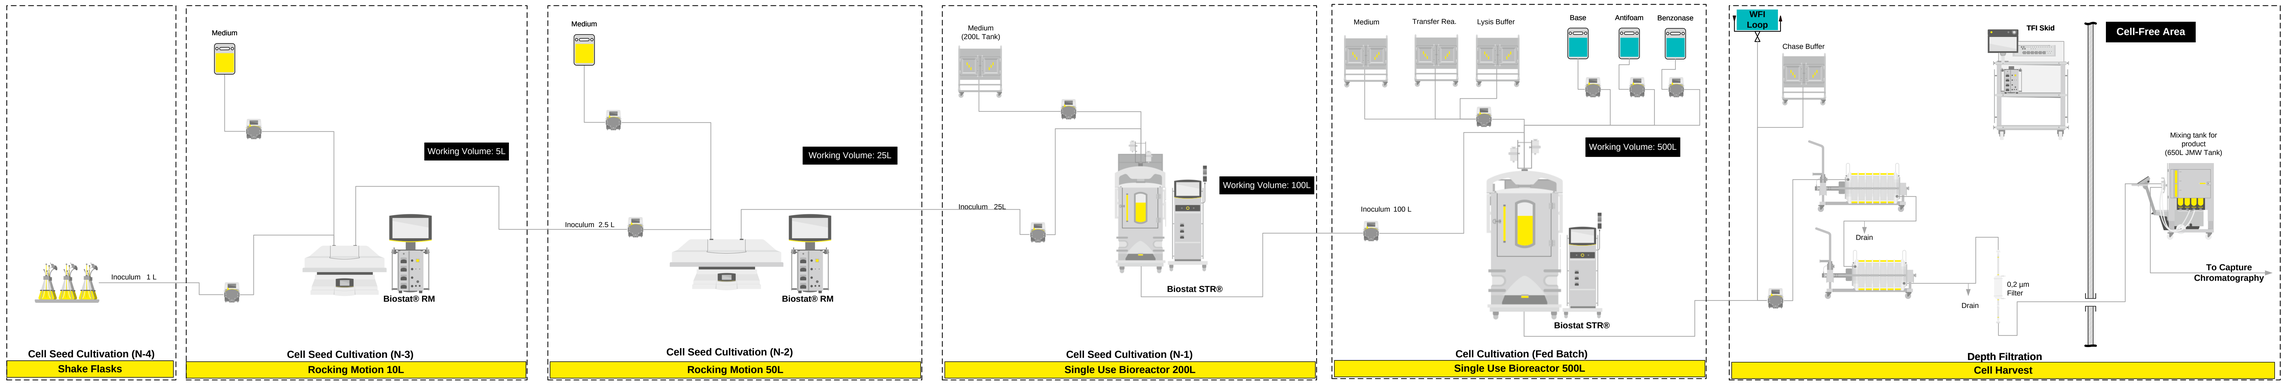
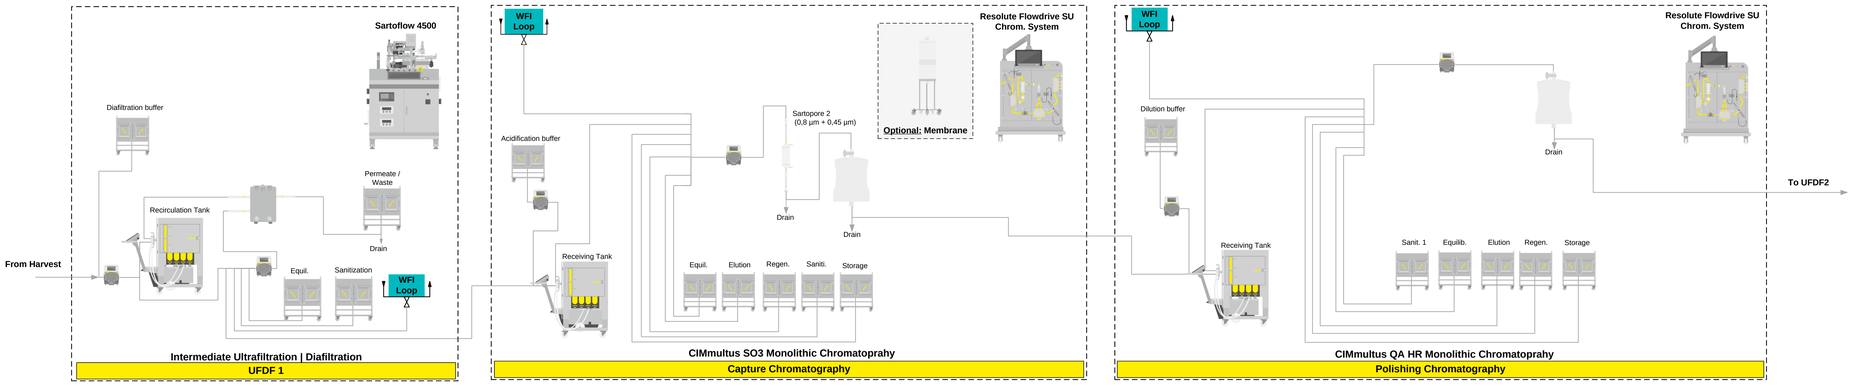
Block Flow Diagram – Adeno-Associated Virus (AAV) 500L

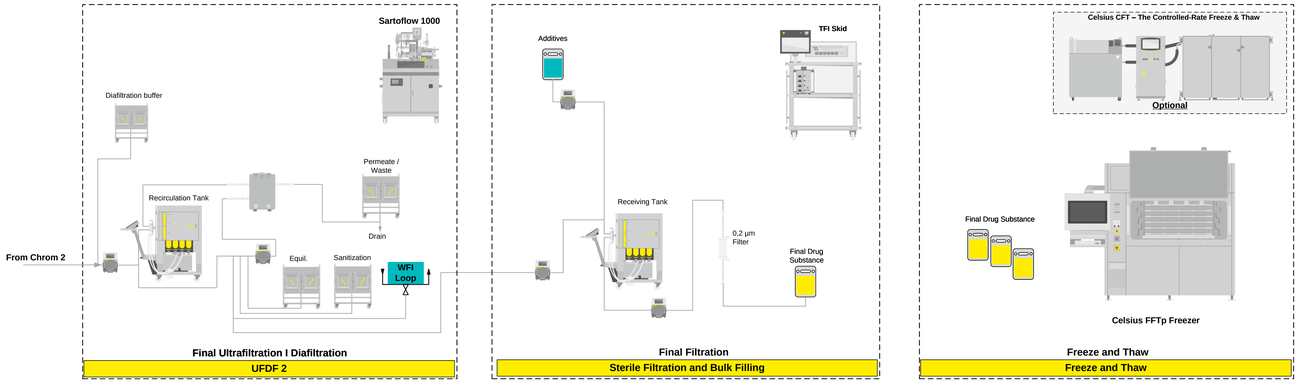
Upstream



Downstream



As contract research organization, Sartorius BIA Separations' facilities are fully equipped to handle process development for particles up to biosafety level 2. Processes suited to different clinical phases up to market supply – developed exclusively on monolithic columns.



Common scales for AAV are 200L, 500L, and 1000L. Larger scales (i.e. 2000L) may require non-standard equipment (for UFDF 1). This document represents the most common scale for this viral vector modality based on our platform approach.

Process customization and equipment sizing is available through a **Conceptual Design**.
